

CLAIMS

1. A method of recognising command related items in a
 body of object code, said command related items
 5 corresponding to command names and/or associated option
 names from a textual programming language^{of, said,}

(the) method comprising: ^{the steps of}

10 entering a list of entries, each comprising a
 required command name and/or option names in programming
 language textual form, into a filter table; -

15 scanning the body of object code for all bit strings
 potentially representing command names and identifying
 such command names;

20 for each ^{of the} potential command names so identified,
 examining a number of succeeding bits for bits which
 represent valid options for each said ^{potential} command name to
 further identify commands having valid combinations of
 command names and options; and

25 for said identified commands, ^{of} comparing said
 identified command names and/or option names in
 programming language textual form with the entries of
 said filter table to determine whether or not they match

any of the list of required command names and/or options
in said filter table.

2. A method as claimed in claim 1, ~~including the further~~ ^{comprising the}
step, ^{of} after said scanning and examining steps, ~~of~~
validating ~~the~~ syntax of each command comprising a
command name followed by one or more valid option names
and comparing only validated command names and ~~or~~ option
names with the entries in the filter table.

3. A method as claimed in claim 2, ^{wherein so} ~~in which~~ said ^{validating} step of
~~syntax validation~~ comprises applying each said command to
a syntax tree. ^{further}

4. A method as claimed in claim 1, ^{wherein} ~~in which~~ said filter
table entries can specify both ^a the presence and ~~the~~ ^{an}
absence of respective command names and/or option names
in the scanned and examined object code.

5. A method as claimed in claim 1, ^{wherein} ~~in which~~ at least
some of said filter table entries include combinations of
command and/or option names, ^{said method further} comprising the ~~further~~ step
of checking ~~the~~ syntax of said combination entries to
the filter table.

6. A method as claimed in claim 1, ^{wherein said} ~~in which~~ the scanning
and examining steps involve comparing object code bit
strings with bit strings extracted from a library which

represent all possible command names and options for said programming language.

5 7. An object code recognition system for recognising command related items in a body of object code, said command related items corresponding to command names and/or associated option names from a textual programming language⁰, said

10 the system comprising⁰:

15 a filter table for holding a list of entries, each comprising a required command name and/or option names in programming language form;

20 an object code scanner for scanning the body of object code for all bit strings potentially representing command names and identifying such command names, said scanner being arranged, in response to identification of each potential command name, to examine a number of succeeding bits for bits which represent valid options for each said command name to further identify commands having valid combinations of command names and options; and

25 a filter for comparing said identified command names and/or option names in programming language textual form with the entries of said filter table to determine

whether or not they match any of the list of required
command names and/or options in said filter table.

5 8. A system as claimed in claim 7, ^{further comprising} includes a syntax
checker for validating the syntax of each command,
comprising a command name followed by one or more valid
option names whereby only validated command names and/or
option names are compared with the entries in the filter
table by said filter.

10 9. A system as claimed in claim 8, wherein said syntax
checker includes a syntax tree.

15 10. A system as claimed in claim 7, ^{wherein} ~~in which~~ said filter
table entries can each specify both ^a the presence and ^{an} the
absence of respective command names and ~~or~~ option names
in the scanned and examined object code, and said filter
is responsive to said specification in determining
whether or not said identified command names and/or
20 option names match said filter table entries

25 11. A system as claimed in claim 7, ^{wherein} ~~in which~~ at least
some of said filter table entries include combinations of
command and/or option names, ^{said system} further comprising ~~a~~ means
for checking the syntax of said combination entries to
the filter table.

12. A system as claimed in claim 7, further comprising a library containing bit strings representing all possible command names and options for said programming language.

5 13. A system as claimed in claim 7, ^{wherein} ~~in which~~ said filter is arranged to generate a list of matching commands.

10 14. A computer program recorded on a medium and executable on a computer to recognise command related items in a body of object code, said command related items corresponding to command names and/or associated option names from a textual programming language, ~~said~~ ^{the} 

15 the program comprising :

20 a filter table data structure for holding a list of entries each comprising a required command name and/or option names in programming language form;

25 object code scanner code for scanning the body of object code for all bit strings potentially representing command names and identifying such command names, said scanner code being arranged, in response to identification of each potential command name, to examine a number of succeeding bits for bits which represent valid options for each said command name to further identify commands having valid combinations of command names and options; and

filter code for comparing said identified command names and/or option names in programming language textual form with the entries of said filter table to determine whether or not they match any of the list of required command names and/or options in said filter table.

15. A computer program as claimed in claim 14, ^{wherein} ~~in which~~ said object code scanner code includes verb objects for representing and identifying command names;

a parameter decoder object for decoding succeeding bits as potentially valid options on identified commands; and

a syntax object for validating the syntax of each command comprising an identified command name followed by one or more valid option names.

16. A computer program as claimed in claim 15, further ^{comprising} ~~including~~ a two dimensional array data structure, ~~the~~ rows and columns of which are indexed by each of a pair of supplied bytes in said object code respectively, and a file parser object for supplying successive pairs of object code bytes to said array, the array comprising pointers to respective verb objects for each pair of supplied bytes representing a potentially valid command,

the file parser object initiating respective verb objects in response to the return of a pointer from said array.
